Default configurations

AOZ provides a simple way to make your development easier : the possibility to define a manifest and a set of memory banks and fonts that will be used for every application you compile.

To include virtual drives in all you AOZ compiled applications:

- Create a 'filesystem' folder in the 'default' directory
- Create folder with the name of the drives you want to emulate
- Copy files and folders in them
- Eventually do the same in the 'filesystem' folder of the application, knowing that if two drives have the same names the content of the directory structure will be merged, and files from both default and application filesystem folders will appear in the drive.
